

# Cancer Support Netherlands (CSN) Employer Project

## Who is CSN?

[Cancer Support Netherlands \(CSN\)](#) is a community-led organisation that supports English-speaking internationals living in the Netherlands who are navigating cancer. CSN was established in 2025 and currently serves a growing, diverse community of approximately 130 members. Its work is based on the reality that around 10,000 English-speaking internationals in the Netherlands are diagnosed with cancer each year, many of whom face additional barriers such as language difficulties, unfamiliar healthcare systems, and limited local support networks. CSN aims to ensure that no one faces cancer alone by offering culturally sensitive, English-language peer support and practical guidance that helps patients, survivors, and caregivers better understand and navigate the Dutch healthcare system.

## Scenario

Many international cancer patients in the Netherlands face a significant challenge that is not just a lack of information but difficulty understanding how to navigate the system. Patients may not know what the next steps are, who to contact, what their rights are, what support is available, or how various organisations fit into their journey. Although trusted public information exists across Dutch websites, this information is often:

- Spread across multiple platforms
- Written in Dutch
- Difficult to compare or navigate in one place
- Not easily structured for English-speaking migrant patients

CSN's longer-term goal is to create a Patient Navigator that can assist patients in understanding their position on their journey and in identifying practical next steps. While students are not expected to develop the final chatbot or tool, this project aims to create a translated, structured data foundation that could support such a tool in the future.

## About the project

In this project, you will act as a data analytics team tasked with creating a robust, structured, English-language knowledge base from trusted Dutch cancer navigation sources.

Your work should focus on:

- Scraping selected, approved Dutch webpages
- Translating the content from Dutch to English
- Preserving hyperlinks and source references
- Structuring the content into a reusable dataset
- Mapping patient questions to trusted answers and next steps
- Tagging the data so that it could support a future Patient Navigator or chatbot
- Suggesting how the dataset could be updated periodically over time

The main required scope for all groups is: ***Understanding Your Care Pathway in the Netherlands***. This is the minimum required focus area and should form the core of every group's analysis.

Based on CSN's guide proposal, this includes topics such as:

- Referrals and process
- Waiting times
- Treatment decisions
- Second opinions
- Additional care and support
- Communication and understanding

Groups may optionally extend into:

- **Orientation** (understanding the system, roles, and rights)
- **First 48 hours after diagnosis** (immediate next steps and support)
- **Active Navigation** (managing care, decisions, and access to services)

This is a data extraction, translation, structuring, and analysis project, rather than a full product build.

## **Deliverables**

As part of this project, you will produce a set of deliverables that demonstrate your ability to extract, translate, structure, and analyse web-based information in a way that supports CSN's future Patient Navigator vision.

At a minimum, your group is expected to produce:

## **Presentation**

A clear, structured summary including:

- Your chosen approach and scope
- The sources used
- Your translation and structuring methodology
- Key findings from your analysis
- How patient questions were mapped to trusted sources
- Recommendations for CSN
- An optional suggestion for how the dataset could support a future interface or chatbot

## **Supporting materials**

a) Python Notebook (or equivalent)

Must include:

- Web scraping or extraction approach
- Translation approach
- Data cleaning and structuring
- Categorisation or tagging logic
- Analysis and visualisation

b) Structured dataset

You must create and submit a dataset that includes fields such as:

- Source organisation
- Source page title
- Original URL or hyperlink
- Scrape date
- Patient journey stage
- Question or topic
- Stakeholder

- Action or next step
- Original Dutch text
- English translation
- Summary or answer text
- Priority or relevance flag

c) Optional dashboard or interface concept

This may include:

- A simple dashboard of questions, sources, and stages
- A wireframe or mock-up of how a future Patient Navigator could use the data
- A search or filter view of the structured dataset

**Technical report**

Including:

- Scope and business problem
- Data sourcing methodology
- Translation and structuring approach
- Key insights
- Limitations
- Recommendations for future use
